Get to Know a Pandas Array

You will use the dataframe df for the following:

```
[5]: import pandas as pd

df=pd.DataFrame({'a':[1,2,1], 'b':[1,1,1]})
df
```

```
[5]:    a  b
0   1  1
1   2  1
2   1  1
```

1) find the unique values in column 'a' :

```
[6]: df['a'].unique()
```

```
[6]: array([1, 2])
```

2) return a dataframe with only the rows where column a is less than two

```
[8]: df[df['a']>2]
df
```

```
[8]:    a  b
0   1  1
1   2  1
2   1  1
```
